

# 7 Months Through Birth

During this time period, the child is fully capable of living outside the womb.

## Partial Birth Abortion D & X

After several days of forced dilation of the mouth of the womb, forceps are inserted and used to pull one of the baby's legs through the birth canal. The baby's body is fully delivered, with the head remaining still inside the birth canal. The abortionist then punctures

the back of the baby's head with sharp scissors, inserts a tube and vacuums out the baby's brain. The now-dead baby is completely delivered. This is the method of choice for baby parts harvesting,

where the baby is dissected and her fresh body parts are sold for research and profit.

## Hysterotomy

This is simply a Cesarean section where the mother's abdomen and womb are surgically opened and the baby is lifted out. The baby is either left to die or is killed by the abortionist just before or shortly after birth by drowning, stabbing, choking or suffocating her.

*"The doctors would remove the fetus while performing hysterotomies and then lay it on the table, where it would squirm until it died...They all had perfect forms and shapes. I couldn't take it, no nurse could."*  
Former Planned Parenthood Director

*These dead babies had reached fetal ages of 18 to 24 weeks before being killed by abortion. This is the*

*result of one morning's work at a Canadian teaching hospital.*

*Babies delivered alive at 21 to 22 weeks can routinely be saved with the proper medical care. Sometimes babies even younger than this can be saved. This is a photo of a baby who was born at just 21 weeks*

*old. Clearly, she is a perfectly formed, precious baby.*

children without parent's  
permission.

## ABORTION METHODS USED BASED ON AGE OF BABY

Abortion in the United States is legal through all nine months of pregnancy. More than 3,200 surgical abortions are performed every day in our nation. Millions more pre-born children are killed by contraceptive chemicals in

popular birth control methods. The types of abortions performed during various stages of development differ greatly because as the child grows, she becomes harder to kill.

## Fertilization Through 3 Months

At conception (fertilization) the baby's complex genetic blueprint is set — establishing gender, skin tone, hair and eye color, etc. At 18-21 days, the baby's heart begins to beat and brain waves can be detected by 40 days. By 8 weeks, when most abortions are performed, all organs and body parts are present. In the first three months the baby can suck her thumb, somersault, hiccup, respond to touch and grasp an object. She grows to over two inches long and to being perfectly formed.

### The Use of Chemicals

The pill, mini-pill, Depo-Provera, Implanon, all varieties of IUD's and the morning after pill (emergency contraception) alter the lining of the uterus, rendering it hostile so that the implantation of the newly created child at 4-7 days cannot occur, causing his or her death. Women using these birth control methods are unaware that sometimes a baby has been conceived and then dies due to the chemical change made to the uterus.

RU-486 is used between the 4th and 7th week and causes the nutrient lining of the uterus to slough off, starving the tiny baby to death. Finally, muscular contractions push the baby out of the uterus.

The woman is administered the drug and sent home to wait as the bleeding begins. At least 20% of women don't abort until some hours or days later. It has taken as long as 12 days. The woman is to collect the remains in a jar and bring them back to the abortion facility to make sure all had been expelled.

*"RU-486 is an appalling psychological ordeal." Edouard Sakiz, Rousel Uclef  
(Manufacturer of RU-486)*

### Suction Method

In this most common abortion method, the cervix is dilated and a hollow tube with a knife-edged tip is inserted into the uterus. The suction machine, 29 times more powerful than a vacuum, rips the baby apart and sucks him into a bottle. Depending upon the gestational age of the baby, the abortionist's assistant then puts the baby back together like a puzzle to make sure no parts of the baby were left in the womb.

*"The sound of the suction machine haunts me to this day. I cannot vacuum a floor without thinking of my abortion." Judy Mamou*

### Dilation and Curettage D & C

A loop-shaped knife is inserted into the uterus and slices the baby to pieces, who is then scraped out.

## 4 To 6 Months

During this time period, the baby grows from five and a half to thirteen inches long and can now hear external sounds. Hair and eyebrows grow and she obtains the ability to cry. A baby born towards the end of this period has a great chance of surviving.

## Dilation and Evacuation

### D & E

Because the bones of the baby are solidly formed by 12 weeks, the abortionist must use an instrument that resembles pliers to grab hold of the baby's body parts and rips them from the baby's body.

*"The sensations of dismemberment flow through the forceps like an electric current." Warren Hern, Abortionist*

### Saline

A 20% salt solution is injected into the sac and mixes with the amniotic fluid. The baby breathes and swallows this caustic fluid and dies painfully over a period of hours from salt poisoning, dehydration, brain hemorrhage and convulsions. The mother goes into labor about a day later and delivers a badly burned, dead baby.

**4 1/2 Month Baby  
Burned by Saline**

*"If the abortion is well done, we don't have to watch the baby die. So we inject a salt solution. The result is like putting salt on a slug, but we don't have to watch it." Dr. Russell Sacco, M.D.*

### Prostaglandin

**6 Months**

A hormone is injected into the mother's uterine muscle and produces violent contractions. The baby is either crushed to death by the contractions or delivered barely alive and left to die.

### Intracardiac Injection (Pregnancy Reduction)

This method is usually used when the mother is carrying more babies than she wants. The abortionist pinpoints the location of the baby's heart using ultrasound. A long needle, filled with fluid, is then injected into the baby's heart causing an immediate heart attack.
